Variheat Series II

Added System Advantages

- The Variheat II can easily be installed in an adjacent plant room
- Supply air ducting can be connected to the Variheat II to recirculate the air, promote uniform conditions throughout the enclosure, and provide a warm air curtain to the glazed areas. This ductwork can be concealed in the roof void or under the floor.
- Space heating is carried out by a fully controlled heater

- battery, fed by a primary hot water circuit from a separate boiler or heat source. This method of air heating promotes consistent air temperatures and eliminates unsightly and hazardous radiators around the pool hall.
- A control panel with displays is incorporated within the Variheat II, reducing overall installation time and the need for extra wiring.
